

# Dynamic White Space Spectrum Access

White space access has come of age over the last few years, turning from a research topic to a commercial activity. It is now being discussed as one of the major approaches for the future to increase spectrum utilisation, to relieve the mobile data crunch and to facilitate sharing with Government and military users. This new book is focussed firmly on the issues of implementation of white space rules, the regulations, devices, databases and the applications that will make this a success. The book starts by looking at the underlying rationale for dynamic access. It then covers the various different ways of detecting incumbent users. Using white space is all about not causing interference and the mechanisms by which this can occur can be defined in general however, as the book shows, every application and incumbent user has their particular differences and each needs to be studied to derive specific protection ratio curves. The book looks at how these have been determined for TV receivers and for wireless microphones. There are detailed chapters on the US and the UK white space regulation explaining the regulations that have been devised, the key parameters, the implications and the issues and problems. There is an extensive chapter covering each of the underlying application areas that are currently most mentioned extended-range Wi-Fi using the IEEE802.11af standard, rural broadband provision using the IEEE802.22 standard and machine-to-machine (M2M) communications using the Weightless standard. The database itself is an important part of white space geo-location access. A chapter written by one of the top database companies covers the challenges, variations, business cases and future developments likely for databases. Finally, no book can resist looking to the future and this one ends with a chapter covering research activities, regulatory strategies and

thoughts on how DSA might become one of the key mechanisms for accessing spectrum in the future.
